

Body Contouring Transformed

COMPANY PROFILE

HIGHLIGHTS...

Osyris Medical designs and commercializes innovative aesthetic laser systems for body contouring and vein removal procedures. The company was founded in 2002 by the Director of the Laser Physics Laboratory and colleagues at the Lille University of Science and Technology, a team whose background and deep expertise in research and development has put the company in the forefront of technological innovation.

Under the leadership of CEO Jaouad Zemmouri, Ph.D., Osyris functions as three separate companies. The first, Osyris Medical, is focused on designing and manufacturing aesthetic lasers for lipolysis. The second, Osyris Industrial, designs and markets high-precision laser and optical components and assemblies for several industries, including telecommunications and manufacturing. The third company is Osyris R&D, which focuses on pharmaceutical, military, telecommunications and fiber optics applications.

While the company's primary focus is within the field of laser light and its interaction with tissue, Osyris also manages innovative projects for smaller companies that opt to outsource their R&D projects. In addition, Osyris R&D teams are contracted to various research institutions and university labs when a specific project calls for their expertise.

The application of so much R&D muscle over the years has resulted in 15 registered patents, multiple peer-reviewed published articles and awards.

In 2008, backed by five years of research and clinical evaluation, Osyris Medical debuted Lipotherme, the first patented 980 diode, continuous wave laser for laser lipolysis.

Validated by a 534 procedure case study, Lipotherme quickly became recognized as a technological breakthrough that caught the attention of both physicians and other laser providers.

Osyris made a significant investment in U.S.-based MedSurge Advances in 2009. Based out of Dallas, Texas with a seven year history in the aesthetic market, Osyris Medical USA is established and has roots firmly established in the American Aesthetic industry.

Osyris is building on the foundations of this achievement with the upcoming release of LipoControl™, the only laser lipolysis device that offers Total Treatment Control.

This unique, integrated feature consists of real-time, on-screen mapping technology that shows the physician where and how much energy per cm² has been delivered to the treatment site. The result is unparalleled control of energy delivery, which in turn will ensure safer, more efficacious procedures.
